Part1: [Book.java]

```
package Lab2b;
```

```
public class Book {  
    private String chapters[];  
    private static final int DEFAULT_CHAPTERS = 10;  
  
    public Book() {  
        chapters = new String[DEFAULT_CHAPTERS];  
        for (int i = 0; i < chapters.length; i++) {  
            chapters[i] = "n/a";  
        }  
    }  
  
    public Book(String argument[]) {  
        chapters = argument;  
    }  
  
    public String getChapter(int i) {  
        return chapters[i];  
    }  
  
    public String[] getChapters() {  
        return chapters;  
    }  
}
```

```
}
```

Part2: [MobileComputer.java]

```
package Lab2c;
```

```
public class MobileComputer extends Computer implements Chargeable{
```

```
    private int battery;
```

```
    public MobileComputer() {
```

```
        secret = "MobileComputer secret";
```

```
        battery = 5;
```

```
    }
```

```
    @Override
```

```
    public void work() {
```

```
        if (battery > 0) {
```

```
            System.out.println("It is working on my lap.");
```

```
            battery--;
```

```
        } else
```

```
            System.out.println("Running out of battery");
```

```
    }
```

```
    @Override
```

```
    public void charge() {
```

```
        if (battery < 10)
```

```
            battery++;
```

```
    }
```

```
}
```

Explanation:

The bug is caused by inheritance. In `mainApp2c.java`, `MobileComputer m` is being called as `Chargeable`, while indeed it's not a `Chargeable`. So I use the keyword `"implements"` and add `"implements chargeable"` to `MobileComputer` to inherit all members and methods from its parent class `Chargeable`. After that, the polymorphism can be performed correctly.
